Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The invention relates to generating ascorbic acid or its salt, involves obtaining a recombinant yeast capable of converting an ascorbic acid precursor into ascorbic acid, culturing the recombinant yeast in a medium comprising an ascorbic acid precursor, thus forming ascorbic acid, and isolating the ascorbic acid. Also include are stabilising ascorbic acid and accorbic acid or its salt and a recombinant yeast functionally ascorbic acid or its salt and a recombinant yeast functionally carniformed with a coding receive dehydrogenase (LGDH), L-galactono-1, 4 lactone dehydrogenase (RGD). D-arabinose dehydrogenase (RGD), D-arabinose dehydrogenase (RD), carbinono-1, 4-lactone oxidase (RD), carbinono-1, 4-lactone oxidase (RD), carbinono-1, 4-lactone oxidase (RD), carbinose dehydrogenase (RD) activity, where the recombinant yeast is capable of converting to ascorbic acid at least about 25% ascorbic acid precursor or is capable of producing at least 20 mg ascorbic acid precursor. The yeast is cultured in a medium comprising one ascorbic acid precursor. The ascorbic acid precursor. The ascorbic acid precursor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           N-PSDB; ABK10125

                                The present invention relates to an isolated protein having L-galactose dehydrogenase (L-galbH) biological activity. L-galbH uncleic acid is useful for generating transgenic organisms and modified pants with enhanced ability to synthesise ascorbic acid. L-galbH facilitate the production of a plant that has been genetically modified to express a mutated L-galbH protein which is resistant to herbicides that act against the naturally occurring L-galbH and to identify and/or design compounds that are inhibitors of L-galbH and to identify and/or design compounds therbicide which acts on L-galbH and damages or kills plants that express the enzyme. The present sequence is Arabidopsis thalian L-galactose dehydrogenase (L-galbH) protein. The L-galbH gene is located on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175, and the encoded proteins (ABBL30773-ABR2072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Genomic DNA from Arthrobacter oxidans F1 was subjected to restriction enzyme analysis and the N-terminal amino acid sequence of L-fucose dehydrogenase determined. A degenerate probe was synthesised based on this amino acid sequence. The probe was used to screen an Arthrobacter CDNA library to isolate a L-fucose dehydro- genase clone. The isolation of such a clone provides a convenient method for produ. of L-fucose dehydrogenase without the need for induction by L-fucose. The probe may be used to evaluate the extent of expression of L-fucose dehydrogenase. The DNA sequence is widely used to assay L-fucose levels. The protein sequence of L-fucose dehydrogenase. (Updated on 25-WAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant comprised plant but the ecombinant DNA construct and growing the transforming a plant with the recombinant DNA construct is useful for improving plant with the comproved properties, e.g. improved cold, heat or drought tolerance, improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to herbicides, extreme osmotic conditions, pathogens or peress, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modification of carbohydrate, nitrogen or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lighting production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the printed specification but was obtained in electronic for form part of the printed specification but was obtained in electronic forms.
   New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

The invention relates to an isolated nucleic acid comprising any one of
the 6213 antisense sequences given in the specification where expression
of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid
conclude acid; (2) a host cell containing the vector; (3) an isolated
contined acid; (2) a host cell containing the vector; (3) an isolated
contypeptide or its fragment whose expression is inhibited by the antisense
controlleration or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for
configuration or the activity of a gene in an operon required for
configuration or that has an activity against a biological pathway
crequired for proliferation, or that inhibits cellular proliferation; (8)
identifying a gene required for cellular proliferation or the biological
configuration or the test compound that inhibits proliferation of an
corganism acts; (9) manufacturing an antibiotic; (10) profiling a
compound's activity; (11) a culture comprising strains in which the extent
compound's activity; (11) a culture computed that inhibits proliferation of
compound's activity; (11) a culture computed that inhibits become
confound's activity; (11) a culture computed that inhibits the
confound's activity; (11) a culture computed that inhibits or collection of
compute is overexpressed or underexpressed; (12) determining the extent
confound's or inhibits processed or underexpressed; (12) determining the extent
confound's or inhibits proliferation of an organism. The antisense mucleic acids required
confounds proliferation or solated enabled mucleic acids are useful for
dentifying processed or seadidate molecules for rational
  drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
Antisense; prokaryotic essential gene; cell proliferation; drug design.
  Zyskind JW;

```
The invention relates to an isolated nucleic acid comprising any one of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibited by the antisense nucleic acid; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required gene or the gene product lies or a gene on which the test compound that inhibits proliferation of an compound, sactivity; (11) a culture comprise or tell gene product lies overexpressed or underexpressed; (12) determining the extent proliferation of an organism acts; (9) manufacturing an antibicit; (10) profiling compound, sactivity; (11) a culture compound that inhibits steed to which each of the strains is present in a culture or collection of the strains; or (13) identifying to homologous nucleic acids are useful for strains; or (13) identifying the target of a compound that inhibits the confidentifying proliferation in cells other than S. aureus, S. typhimurium, CC dentifying decovery programs, or for screening homologous nucleic acids acids required for proliferation in cells other than S. aureus, S. typhimurium, CC the target prokaryotic essential genes. Note: The sequence data for this parent did not form part of the printed specification, but was obtained for the printed specification.

polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypetide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa attuges for antibacterial drugs, production of P. aeruginosa templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target of Pseudomonas species using biochip technology. Sequences or other sequences of Resudomonas species using biochip technology. Sequences AB067826-AB084396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification but, was obtained in electronic format from USPTO at
  Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.

```
useful for generating transgenic organisms and modified pants with enhanced ability to synthesise ascorbic acid. L-galDH facilitate the production of a plant that has been genetically modified to express a mutated L-galDH protein which is resistant to herbicides that act against the naturally occurring L-galDH and to identify and/or design compounds that are inhibitors of L-galDH. The compounds can be used, for e.g. in a herbicide which acts on L-galDH and damages or kills plants that express the enzyme. The present sequence is Arabidopsis thaliana L-galactose dehydrogenase (L-galDH) cDNA. The L-galDH gene is located on chromosome 4

The invention relates to generating ascorbic acid or its salt, involves obtaining a recombinant yeast capable of converting an ascorbic acid precursor into ascorbic acid, culturing the recombinant yeast in a medium comprising an ascorbic acid precursor, thus forming ascorbic acid, and soluting the ascorbic acid, and conjusting the ascorbic acid, and isolating the ascorbic acid. Also include are stabilising ascorbic acid or its salt in a medium, by culturing a yeast in a medium comprising a scorbic acid or its salt and a recombinant yeast functionally considered at a recombinant yeast functionally considered from L-galactose dehydrogenase (LODH), L-galactonally carbinono-1, 4-lactone oxidase (ADD), D-arabinose dehydrogenase (ADD) activity, where the recombinant yeast is capable of converting to ascorbic acid at least about 25% ascorbic acid precursor of converting to ascorbic acid at least about 25% ascorbic acid precursor or is capable of producing at least 20 mg ascorbic acid/L medium, when the yeast is cultured in a medium comprising one ascorbic acid precursor. The second produced (Vitamin C) is a powerful antioxidant, a deficiency of which causes scurvy in humans. The present sequence encodes

ACN48774 RESULT

BP ACN48774 standard; cDNA; 564

(first entry) 02-DEC-2004

Cotton primed seed EST Clone ID: LIB3825-027-06-K6-G2, SEQ:3555.

Cotton; plant; EST; expressed sequence tag; transgenic plant; seed; variety PSF08; library LIB382; molecular tag; molecular marker; genetic mapping; molecular mapping; seed germination; plant growth; plant qrowth; plant yield; plant breeding; tissue printing; se.

Gossypium hirsutum

US2004123340-A1.

24-JUN-2004

12-DEC-2001; 2001US-00021323 

14-DEC-2000; 2000US-0255619P.

The invention relates to 17880 cotton expressed sequence tags (ESTB;
ACNA5220-ACN63099). The ESTB were isolated from CDNA libraries generated
C from primed or non-primed seeds from variety DPS50B, mature seeds from
C variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium
C tissue, developing fibres, carpel walls and septa from variety
CC Nucotton3B. The invention also relates to substantially purified
CC invention, and to transformed plants having a nucleic acid molecules of the
invention, and to transformed plants having a nucleic acid construct
CC comprising a nucleic acid of the invention. The cotton ESTB are useful as
CC determine gene function and to determining whether genes are
CC members of a particular gene family. The nucleic acid molecules may be
CC used for isolateing a variety of agronomically significant genes
CC used for isolateing avariety of agronomically significant genes
CC associated with plant growth, quality, yield, and could also serve as
CI inks in metabolic and catabolic pathways. The nucleic acid molecules are
CS associated with plant growth, quality, yield, and could also serve as
CS inks in metabolic and catabolic pathways. The nucleic acid molecules are
CS during seed germination. The ESTS additionally enable the acquisition of
CS promoters and cis-regulatory elements which will be useful for corporation and cis-regulatory elements which will be useful for corporation to genes. The nucleic acid molecular markers useful for
CC detecting the expression level or pattern of a protein or mRNA and for
CC detecting the presence or quantity of a protein or mRNA and for
CC detecting the expression level or pattern of a protein or mRNA and corporated patence appeasents a specifically claimed BST isolated from a
CC cotton variety DPSOB primed seed coming of a protein or mRNA and corporation or part of the printed specification of the printed specification of the printed seed coming and the printed seed coming and the printed seed coming and the printed seed coming and the printed New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular tags to map genes. segdata.uspto.gov/sequence.html?DocID=US20040123340 Ziegler TB; Claim 1; SEQ ID NO 3555; 34pp; English. members of a particular gene family. The nucleic acid molecules may be members of a particular gene family. The nucleic acid molecules may be casciated with plant growth, quality, yield, and could also serve as links in metabolic and catabolic pathways. The nucleic acid molecules are also useful for identifying genes important in initiating and maintaining seed germination or that may be used to mitigate stresses encountered during seed germination. The BSTs additionally enable the acquisition of promoters and cis-regulatory elements which will be useful to express any significant genes in these tissues and/or other tissues, and also permits the acquisition of molecular markers useful in breeding schemes, genetic and molecular mapping, and in cloning of agronomically chemes, genetic and molecular mapping, and in cloning of agronomically catentificant genes. The nucleic acid molecules are further useful for detecting the expression level or pattern of a protein or mRNA and for detecting the presence or quantity of a protein by tissue printing. The present sequence represents a specifically claimed BST isolated from a cotton variety DPSOB primed seed cDNA library (LIBBSES). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the US patent office at

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) an bost cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that inhibits a phological pathway required for proliferation, or that thas an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the test compound that inhibits proliferation of an organism. The antisense nucleic acids are useful for to which each of the strains is present in a culture or collection of strains proliferation of an organism. The antisense nucleic acids are useful for form form proliferation in cells other changes are useful for cultured for proliferation in cells other than S. sureus, S. typhimurium, K. pneumonlasor P. seruginosa. The present sequence data for this patent did correct format directly form MIPO at compound the contract of the princed specification, but was obtained in cells other expenses and contract of contract of the princed specification. The sequence data for this patent did contract of the princed specification of the princed specification of the princed specification of the princ
  New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABIJ6176, ABIJ30511), expressed DNA sequences (ABIJ61775) and the encoded proteins (ABBS70777-ABBJ2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
   detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell

An Arabidopsis full-length cDNA library was constructed essentially
as reported previously (Seki et al., 1998).cDNA cleaved with BamHI
and XhoI was ligated to modified Lambda FLC-1 vector (Carninci et
al., submitted for publication) digested with BamHI and SalI. This
clone is in a modified pBluescript vector. Please visit our web
site (http://www.gsc.riken.go.jp/e/plant/index_e.html) for further
details.
   Bukaryota, Viridiplantae, Streptophyta, Embryophyta, Tracheophyta, Spermatophyta, Magnollophyta, eudicotyledons, core eudicots, rosids, eurosids II; Brassicales; Brassicaceae, Arabidopsis.

Patent No. 6610836
GENERAL INFORMATION:
APPLICANT: GATY Breton et. al
TITLE OF INVENTION: NUCLEIC ALID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: PNEUMONIAE FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFREENCE: 2709.2004.001
CURRENT APPLICATION NUMBER: US/09/489,039A
CURRENT FILING DATE: 2000-01-27
PRIOR APPLICATION NUMBER: US 60/117,747
PRIOR FILING DATE: 1999-01-29

   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

   AB0808
probable ion-channel protein STY2647 [imported] - Salmonella enterica subsp. enterica serovar Typhi
(Species: Salmonella enterica subsp. enterica serovar Typhi
A;Note: this species has also been called Salmonella typhi
C;Date: 09-Nov-2001 #sequence_revision 09-Nov-2001 #text_change 18-Nov-2002
C;Accession: AB0808
R;Parkhill, J.; Dougan, G.; James, K.D.; Thomson, N.R.; Pickard, D.; Wain, J.; Churcher, th, T.; Connerton, P.; Cronin, A.; Davis, P.; Davies, R.M.; Dowd, L.; White, N.; Farrar, S.; Moule, S.; O'Gaora, P.
Nature 413, 848-852, 2001
A;Authors: Parry, C.; Quall, M.; Rutherford, K.; Simmonds, M.; Skelton, J.; Stevens, K.; A;Reifle: Complete genome sequence of a multiple drug resistant Salmonella enterica serov A;Reference number: AB0502; MUID:21534947; PMID:11677608
A;Accession: AB0808
A;Status: preliminary
A;Molecule Lype: DAR
A;Residues: 1-332 < PAR>
A;Cross-references: GB:AL513382; PIDN:CAD07644.1; PID:g16503631; GSPDB:GN00176
C;Genefics:
A;Gene: SYY2647
C;Superfamily: fission yeast pyridoxine 4-dehydrogenase

  The Salk, Stanford, PGEC (SSP) Consortium members carried out the sequencing and annotation of the RAFL cDNAs: Koesema, E., Chen, H., Cheuk, R., Kim, C.J., Meyers, M.C., Shinn, P., Banh, J. Bowser, L., Dale, J. M., Goldenith, A.D., Jiang, P.X., Jones, T., Karlin-Neumann, G., Ondera, C.S., Palm, C.J., Pham, P.X., Quach, H.L., Southwick, A., Davis, R.W., Trang, C.C., Toriuni, M., Yamada, K., Yamamura, Y., Yu,G., Yu,S., Davis, R.W., Theologis, A., and Ecker, J.R.
Submitted (06-AUG-2001) Salk Institute Genomic Analysis Laboratory (SIGNAL), Plant Biology Laboratory, The Salk Institute for Biological Studies, 10010 N. Torrey Pines Road, La Jolla, CA 92037, USA

  EIKEN Genomic Sciences Center (GSC) members carried out the collection and clustering of RAFL CDNAs (RAFL CDNA; 'RIKEN trabidopsis Full-Length CDNA'): Seki,M., Narusaka,M., Ishida,J., Satou,M., Kamiya,A., Sakurai,T., Carninci,P., Kawai,J., Hayashizaki,Y. and Shinozaki,K.
  AspTyrIleValAlaThrLysCysGlyArgTyrLysGluGlyPheAspPheSerAlaGlu 100
   Koesema, E. (SSP/Salk) and Seki, M. (RIKEN GSC) contributed equally to this work. Shinozaki, K. (RIKEN GSC) and Ecker, J.R. (SSP/Salk) contributed equally to this work as Pis.
